Let's Start!

Let's look at the stars!

Learning Outcome

Describe events in the past through a wider range of B1 language in both work and social contexts.

Ask your partner:

- What do you know about our solar system and beyond?
- If you had a chance to go out into space would you take it? Why or why not?

Can Do Statements

- I can talk about technology and subjects of study.
- I can talk cause and effect.
- I can express possibility and certainty.

Let's Explore!

Let's log onto the **NASA*** website!

* "NASA" is the *National Aeronautics and Space Administration*.

Instructions: Read the text aloud.

Even the earliest civilizations performed methodical observations of the night sky. However, the invention of the telescope was required before the stars and planets could be seen and astronomy could be developed into a modern science. With their eyes on the heavens, men began to wonder whether the stars and planets they saw could be explored.

The Earth's strong gravitational pull would have to be overcome before rockets could escape the stratosphere. If you do some research, you'll find out this didn't happen until the 20th century.

If you Google the "space race", you can read how the US and the Soviet Union took turns sending satellites and men into orbit. The ultimate goal though, was supposed to be a moon landing. The whole world waited to see who the race would be won by. If you have heard of Neil Armstrong, you may know that he was the first person to walk on the moon.

Since that day, space exploration has gone even farther. If you log onto the NASA website, you will see pictures and data sent back by dozens of space probes. Even more information could be sent back by those still traveling. Still more probes are planned.

If technology permits, there is no doubt that manned space exploration will one day take us to Jupiter, past the boundaries of our solar system, or even beyond.

Let's Practice!

Let's talk about space exploration.

Instructions: Organize the mystery sentences. Read the sentences aloud. Check your pronunciation with your instructor.

1. century. / until / this / you / you'll / out / research, / 20th / the / some / find / If / happen / do / didn't

2. the / and / you / read / US / you / Google / Space / Union / and / satellites / Race, / Soviet / how / into / can / orbit. / the / sending / turns / If / men / the / took

3. first / he / Neil / was / that / person / the / Armstrong, / If / walk / on / heard / you / you / the / moon. / of / may / have / to / know

4. will / and / probes. / NASA / onto / website, / sent / of / see / you / the / dozens / log / If / pictures / back / by / space / data / you

5. If / space / permits, / doubt / day / Jupiter. / us / will / no / there / exploration / technology / manned / that / take / one / is / to

Let's Practice!

Is it possible or certain? Let's find out.

Instructions: Read the sentences. Write Possibility or Certainty.

1. Astronomy could only then be developed into a modern science. _____
2. The whole world waited to see who the race would be won by. _____
3. Even more information could have been sent back by those still travelling.

4. Meg began to wonder whether the stars and planets they saw could be explored.

5. The invention of the telescope must have been required before the stars and planets could be seen. _____

Extension Activity

Write a report on NASA.

Instructions: Complete the following steps. Fill in the Self-Assessment.

- Look up NASA online or at the library and find something about it that interests you.
- Read about the topic and make notes.
- Summarize your findings in a paragraph.
- Highlight any technical words that you use.
- Read your summary to another student and explain the technical words.

Self-Assessment

Yes No

I find out about NASA.

☐ ☐

I make notes and summarize my findings.

☐ ☐

I highlight technical words and prepare to explain them.

☐ ☐

I share my information with another student.

☐ ☐

Target Words

- telescope** (noun): a piece of equipment shaped like a tube that you look through to make objects that are far away appear larger and nearer
e.g. The invention of the telescope was required before the stars and planets could be seen.
- astronomy** (noun): the science which studies the universe beyond the Earth's atmosphere
e.g. Astronomy was developed into a modern science after the invention of the telescope.
- heavens** (noun): the space that surrounds the Earth
e.g. With their eyes on the heavens, men began to wonder whether the stars and planets they saw could be explored.
- stratosphere** (noun): the layer of the Earth's atmosphere between about 6 and 30 miles above the surface of the Earth
e.g. The Earth's strong gravitational pull would have to be overcome before rockets could escape the stratosphere.
- gravitational** (adjective): connected or pulled together by a strong force
e.g. The Earth's strong gravitational pull would have to be overcome before rockets could escape the stratosphere.
- satellite** (noun): an object that revolves around a planet
e.g. There are satellites in space that revolve around our planet.
- to orbit** (verb): to follow a circular path around another object like a sun or a planet
e.g. The US and the Soviet Union took turns sending satellites and men into orbit.
- NASA** (noun): an agency of the USA whose acronym means National Aeronautics and Space Administration
e.g. If you log onto the NASA website, you will see pictures and data sent back by dozens of space probes.
- probe** (noun): an object that explores the solar system and transmits data back to Earth
e.g. Space probes send pictures and data from space back to Earth.
- solar** (adjective): related to the sun
e.g. Manned space exploration will one day take us to Jupiter, past the boundaries of our solar system, or even beyond.

Learning Points

The First Conditional

You use the First Conditional to talk about real possibilities in the future.

You use the First Conditional to say it's possible that you will do something. In that condition, something else will happen.

If clause	Main Clause
<i>If you do some research,</i>	<i>you'll find out this didn't happen until the 20th century.</i>
<i>If you have heard of Neil Armstrong,</i>	<i>you may know that he was the first person to walk on the moon.</i>

Examples:

- *If you google the Space Race, you can read how the U.S. and the Soviet Union took turns sending satellites and men into orbit.*
- *If you log onto the NASA website, you will see pictures and data sent back by dozens of space probes.*
- *If technology permits, there is no doubt that manned space exploration will one day take us to Jupiter, past the boundaries of our solar system, or even beyond.*

Learning Points

Modal Verbs in the Passive Voice

You use modal verbs to add meaning to other verbs. They come before the dictionary form (infinitive without *to*) of the main verb.

Modal verbs can add meaning connected with certainty or obligation.

You can use modal verbs in the passive voice.

You use the passive voice when you want to focus on the "receiver" of the action, rather than the "doer" of the action.

Here is the structure of a passive sentence:

Subject + To be + past participle

You can add a modal verb before the To be:

Subject + modal + To be + past participle

For example:

- *Astronomy **could** only then **be developed** into a modern science.*
- *The whole world waited to see who the race **would be won by**.*

Examples:

- *The invention of the telescope was required before the stars and planets could be seen.*
- *Astronomy could only then be developed into a modern science.*
- *Men began to wonder whether the stars and planets they saw could be explored.*
- *The whole world waited to see who the race would be won by.*
- *The Earth's strong gravitational pull would have to be overcome before rockets could escape the stratosphere.*
- *Even more information could be sent back by those still travelling.*
